My 3d graphical system comes from nature's ordering and a place where ordinary people look least often. A blue whale's bones. From an order that you never see from a daily perspective, shown only in museums and seen in reality only from close-ups. Everything from this new order turns this colossal endangered animal into no more than a bowl fish on top of your table. Ribs and tailbones rearranged into graphical systems that doesn't necessarily comply with anatomical rules of the animal.

To add a layer of detail between the system and what's left of the animal, I've etched the geographical information of the first blue whales sighted on the shores of Quebec from 1980 to 2008. And used mostly glass materials to symbolize how fragile their numbers are compared to their sizes.
